For this week's assignment, I will be discussing the pros and cons of self-driving cars. This topic is important because many people are moving away from cities and must take long commutes to and from work, thanks to the rising cost of living. Self-driving cars could solve this problem by using highly efficient routes that get people from Point A to Point B quickly. Also, a self-driving car could reduce accidents and therefore make transportation a less stressful experience. There are many components that will be needed to create a high-quality self-driving car. Some of these components include various sensors and cameras, a GPS, and actuators.

There are many ethical issues to consider when implementing self-driving abilities for vehicles. First, the algorithm for the car should be fine-tuned to ensure that it does not go over the speed limit, pass red lights, or violate other traffic laws that could put people in danger. Second, there is the potential for carjackers to hack into the car's computer system and use it against the driver. For such cases, cybersecurity is a must. Third (and finally), it is important that a person able to operate a vehicle always be in the car because, even with careful programming, AI can still make potentially harmful mistakes. This way, the driver can intervene to prevent or mitigate an accident.
